## TRIMMING INSTRUCTIONS

Climbing skins should not exceed the running surface of the ski. If your skins exceed this length, trim with scissors or the included trim tool. If, at any point, you intend to retrofit your skin with an after market tail clip kit, before installation, it is recommended that you test fit the kit before you trim any excess skin material from the tail.

If the width of the skin exceeds the width of the ski, center the skin on the ski and use the metal edge as a guide for the trim tool when trimming the width. Always trim from the tip to tail.

It is recommended to trim the tail of the skin to match the contour of the tip of the skin where the tip loop is attached. This will help prevent any glue from being exposed when the skins are folded glue to glue.

## STORAGE & USE

- 1.) Always store skins folded, adhesive side to adhesive side.
- 2.) Do not store in temperatures above 90°F (32°C)
- 3.) Pull the skins apart before applying them to your skis. Rub your hand down the length of the skin to create heat and improve adhesion.
- 4.) On cold days, store your skins inside your jacket to keep them warm and to increase adhesion when doing multiple laps.
- 5.) Avoid getting snow on the adhesive side and keep the ski bases as dry as possible before applying skins.
- 6.) In the spring, when the snow is warm and wet, it may be necessary to apply skin wax. We recommend Ascension Glop Stopper.
